

Pod D Belief State Comparison

This document explains the AI outputs in simple language for demonstration purposes.

Simple Explanation

THEN: The AI estimates the professor's state using only the information available on **5 February 2026**.

NOW: The AI revisits the same date after learning what happened later. With additional evidence, it updates its understanding of the professor's state.

The value after the $\pm$ symbol represents uncertainty. A smaller $\pm$ value means the AI is more confident in its estimate because it has more evidence.

System Output

Variable	THEN	NOW	Change
Mood	6.57 (± 2.00)	6.53 (± 0.34)	-0.04
Focus	7.84 (± 2.00)	6.02 (± 0.34)	-1.82
Stress	5.67 (± 2.00)	5.80 (± 0.34)	+0.14
Confidence	5.00 (± 2.50)	5.00 (± 0.43)	--
Motivation	5.05 (± 2.50)	5.65 (± 0.43)	+0.60
Trust	5.02 (± 3.50)	5.97 (± 0.60)	+0.96
Social Engagement	5.06 (± 3.00)	5.68 (± 0.51)	+0.62

Interpretation

- Mood changed very little, showing the professor's overall emotional state remained stable. However, the uncertainty decreased because more evidence became available.
- Focus was revised downward after later events suggested the period of intense research activity had naturally settled.
- Stress changed only slightly, indicating later evidence did not significantly alter the original estimate.
- Confidence stayed at the same value, but the uncertainty became much smaller due to additional information.
- Motivation increased because later achievements suggested the professor was more motivated than originally estimated.
- Trust increased after later positive events reinforced the professor's relationship with students and research progress.
- Social Engagement increased because later events showed continued interaction and collaboration.
